Project Overview

This project analyzes transactional data from food delivery platforms to evaluate customer demand cycles, logistics timelines, courier distribution profiles, and regional trends. The analysis combines data preparation in Python (Pandas, NumPy) and SQL, culminating in interactive Tableau visualizations.

Key Project Features

- **Interactive Dashboard:** Dynamic exploration of platform throughput across cuisines, delivery times, and driver ratings.
- **Guided Data Story:** A slide-by-slide data narrative tracing order trajectories, bottleneck zones, and peak congestion timings.
- **Documented Insights:** Comprehensive write-ups on analytical objectives, KPIs, dataset variables, and recommended platform improvements.
- **Premium SaaS Aesthetics:** Tailored styling with responsive flex grids, glassmorphic blur cards, radial glow designs, and scroll-linked animation transitions.

Technology Stack

- **Data Cleaning & Preparation:** Python (Pandas, NumPy), SQL (MySQL/PostgreSQL), Microsoft Excel
- **Visualization Canvas:** Tableau Desktop / Tableau Public
- **Frontend Architecture:** HTML5 (Semantic Structure), CSS3 (Custom Variables, Transitions, Glassmorphism, Layouts), JavaScript (IntersectionObserver, Count-up animations, navigation controllers)
- **External Typography & Graphics:** Google Fonts (Poppins & Inter), Font Awesome Icons

Project Architecture
