

Ideation Phase

Date	14 July 2026
Project Name	Food Ordering Behaviour and Customer Trends
Team Member	Bhoomi Jain
Maximum Marks	4 Marks

Brainstorm & Idea Prioritization Template

The brainstorming process provided a free and open environment that encouraged participation in the creative-thinking process leading to problem solving for the project, *Food Ordering Behaviour and Customer Trends*. Prioritising volume over value, out-of-the-box ideas were welcomed and built upon to develop a rich set of analytical and design ideas.

This document records the use of a structured brainstorming and prioritization process to move from an open problem space to a focused, feasible project plan.

Step-1: Team Gathering, Collaboration and Select the Problem Statement

The team **Bhoomi Jain** came together to define the scope of the project. Relevant background on food-delivery datasets and prior Tableau dashboard examples was shared ahead of the session, and availability and roles were confirmed before the session began.

PROBLEM STATEMENT

How might we analyse food ordering behaviour and identify customer ordering trends using data analytics, so that food delivery platforms and restaurants can make informed, data-driven decisions about menu planning, pricing, and customer engagement?

Key Rules of Brainstorming Followed

- **Stay on topic:** Keep every idea tied to the problem statement on food ordering behaviour.
- **Encourage wild ideas:** Unconventional analytical angles were welcomed before being filtered.
- **Defer judgment:** No idea was rejected during the listing stage; evaluation came later, in Step-3.
- **Listen to others:** Reviewed and built upon ideas shared.
- **Go for volume:** The goal in Step-2 was quantity of ideas, not immediate quality.
- **Be visual:** Ideas were grouped and plotted visually to aid shared understanding.

Step-2: Brainstorm, Idea Listing and Grouping

Bhoomi Jain

- Collect food ordering data covering order time, cuisine type, order value, city, and delivery duration.
 - Segment customers by order frequency: one-time, occasional, and frequent buyers.
 - Design an interactive Tableau dashboard showing order trends by city, cuisine, and time of day.
 - Build a responsive website to host and present all project outputs.
- Study peak ordering hours across weekdays versus weekends to understand daily demand patterns.
 - Analyse the impact of discounts and promotional offers on order volume.
 - Build a Tableau Story to narrate key insights in a logical sequence.
 - Publish the Tableau dashboard on Tableau Public for open accessibility.
- Analyse which cuisine types are most frequently ordered across different cities.
 - Examine the relationship between order value and delivery time.
 - Standardise and clean raw data to remove duplicate, missing, or inconsistent entries before analysis.
 - Track average order value trends across different customer segments.
- Explore the correlation between restaurant ratings and order volume.

Bhoomi Jain

- Investigate customer payment method preferences (cash, card, wallet, UPI).
 - Add dashboard filters for restaurant type, price range, and delivery time.
 - Use heat maps to visualise order density by location and hour.
-
- Include KPI cards for total orders, average order value, and repeat-customer rate.
 - Host project code, datasets, and documentation on GitHub for transparency.
 - Ensure the website and embedded dashboard are mobile-friendly.
 - Add a summary/insights page on the website linking to the live dashboard and story.

Grouped Ideas (Thematic Clusters)

Cluster A — Data Collection & Preparation (Led by: Bhoomi Jain)

- Sourcing food-ordering data (order time, cuisine, value, city, delivery duration).
- Cleaning and standardising raw data removing duplicates and missing values.
- Identifying peak ordering hours and demand patterns by day/time.

Cluster B — Customer Behaviour & Segmentation (Led by: Bhoomi Jain)

- Segmenting customers by order frequency and value.
- Studying the effect of discounts/offers on order volume.
- Analysing payment method preferences and rating-order correlations.

Cluster C — Dashboard & Visualization Design (Led by: Bhoomi Jain)

- Building the interactive Tableau dashboard with filters and KPI cards.
- Creating the Tableau Story to communicate insights.
- Designing heat maps for order density by location and time.

Cluster D — Deployment & Accessibility (Led by: Bhoomi Jain)

- Publishing the dashboard on Tableau Public.
- Building and hosting the responsive project website.
- Maintaining the GitHub repository for code and documentation.

Step-3: Idea Prioritization

With the clustered ideas in hand, the ideas were plotted on an Importance-versus-Feasibility grid to agree on what mattered most and what was realistically achievable within the project timeline and available dataset.

Quadrant	Ideas
Do First	Data Cleaning & Preparation; Interactive Tableau Dashboard; Customer Segmentation Analysis
Plan Next	Predictive Ordering Trend Modelling (kept as future scope due to limited feasibility with the current dataset)
Fill-in Tasks	Tableau Story Narrative; Responsive Website & Public Deployment; Payment Method Preference Study
Reconsider	Discount/Offer Impact Analysis (retained only as a secondary insight, not a core deliverable)

The ideas placed in the “Do First” quadrant — data cleaning and preparation, the interactive Tableau dashboard, and customer segmentation analysis — formed the core of the completed project, and were carried forward into the dataset collection, cleaning, Tableau Dashboard, Tableau Story, and Tableau Public deployment stages.

The Tableau Story narrative and the responsive website/public deployment were treated as important supporting deliverables and were completed alongside the core analysis. Predictive ordering-trend modelling was consciously deferred as future scope, since it required a longer time-series dataset than was feasible for the current project.
